Project Title
WebApp: SweetAware

Year Accomplished
2025

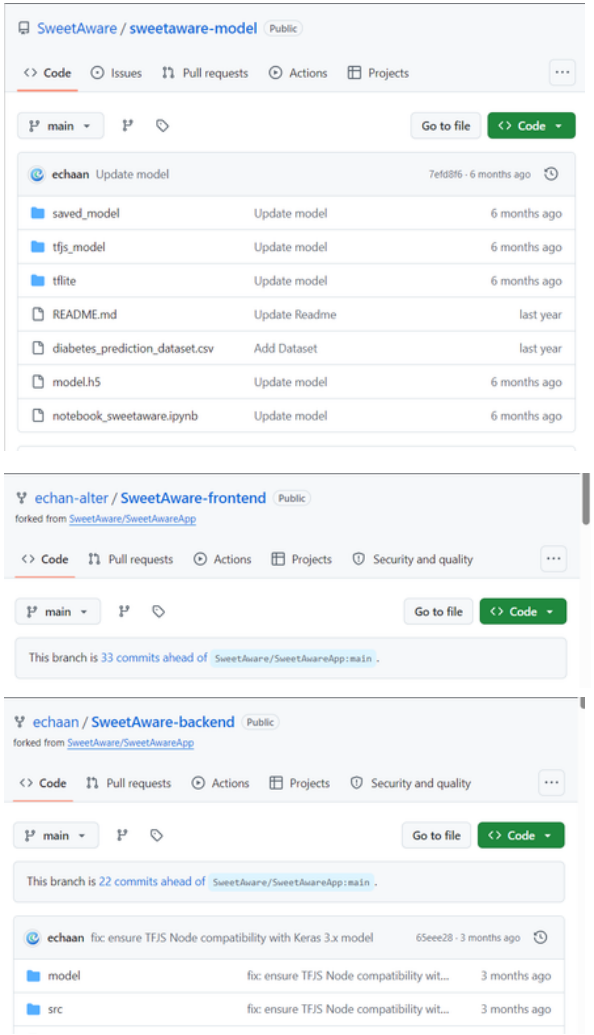

Role
Machine Learning Engineer (Group Project)

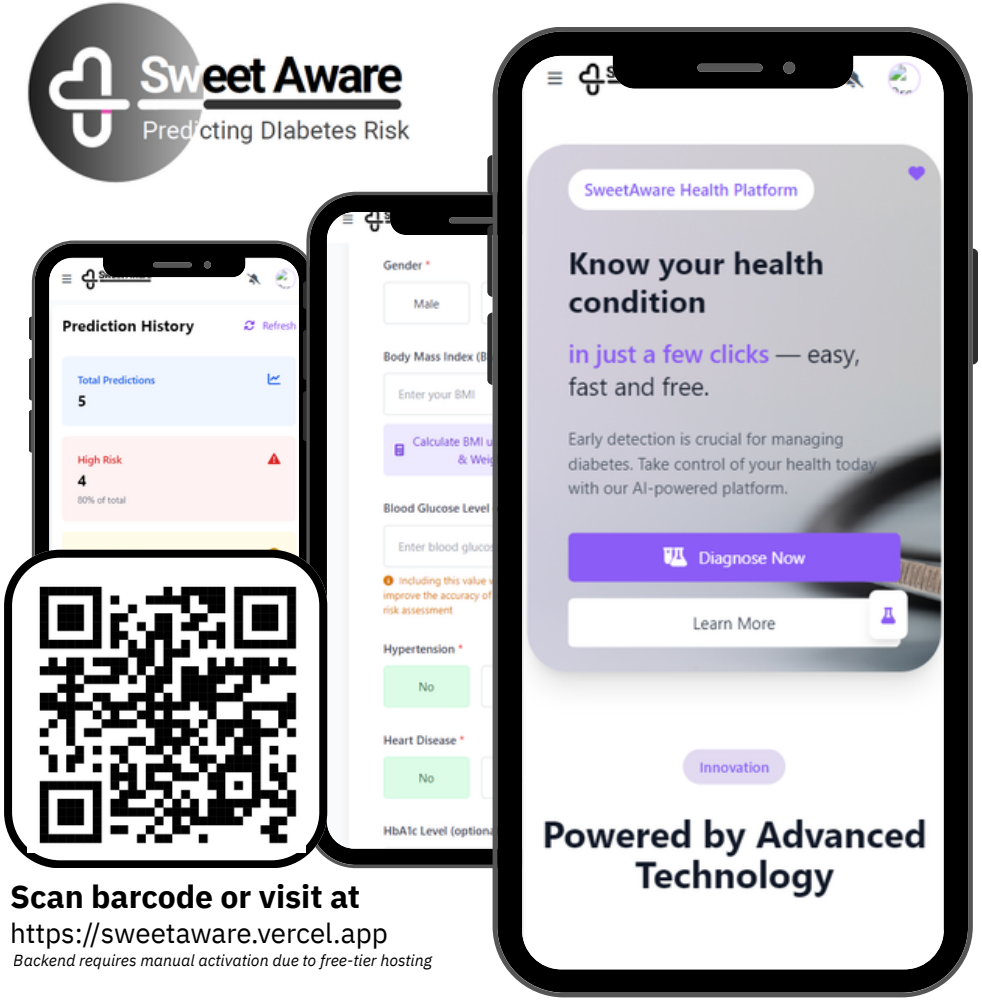

As the ML Engineer, I selected and evaluated the dataset, conducted exploratory data analysis (EDA), performed data preprocessing, converted the trained model to TensorFlow.js for browser-side inference, and documented the model development process.

What I Learned
This project taught me the value of structured remote collaboration, as our team worked across different islands through weekly online discussions and mentor meetings using Google Meet, Zoom, Discord, GitHub, and Google Docs, making communication and consistency just as important as technical skills.

Project Description
Diabetes cases in Indonesia have surged from 7.3 million (2011) to 20.4 million (2024), with 73.2% of cases undiagnosed. Existing tools like Halodoc's Diabetes Risk Calculator rely solely on questionnaires without deeper analysis, leaving a gap for accessible, personalized early detection. SweetAware addresses this by combining machine learning with a full-stack web application. We trained a TensorFlow model on the Kaggle Diabetes Prediction Dataset, achieving 97% accuracy, to predict diabetes risk based on personal health inputs such as BMI, blood pressure, and glucose levels. Unlike existing solutions, SweetAware stores prediction history, delivers personalized health recommendations making it a comprehensive preventive health tool, not just a calculator
